People

COAPS has 59 people working on research grants with expenditures in excess of \$3.5 M per year. Current personnel include:

- 8 Faculty (also part of EOAS and Scientific Computing)
- 22 Research Scientists and Post-Docs
- 21 Graduate Students
- 4 Undergraduate Students
- 4 Administrative Personnel

Ocean Modeling

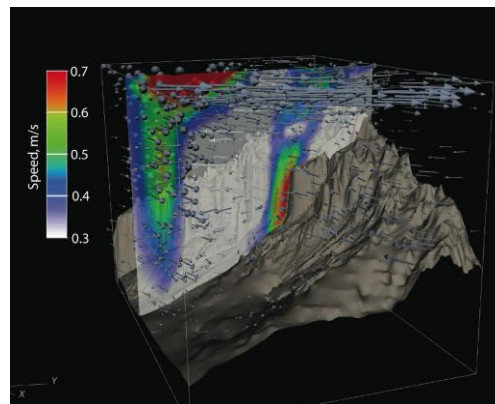

Ocean models are complex computer programs that simulate the physical state and dynamic properties of oceans. COAPS uses global and regional models to study oceanic processes, such as responses to storms, ocean circulation, and water mass formation, and to improve both short- and long-term forecasts.

- Analysis of sea surface height using the HYbrid Coordinate Ocean Model (HYCOM).

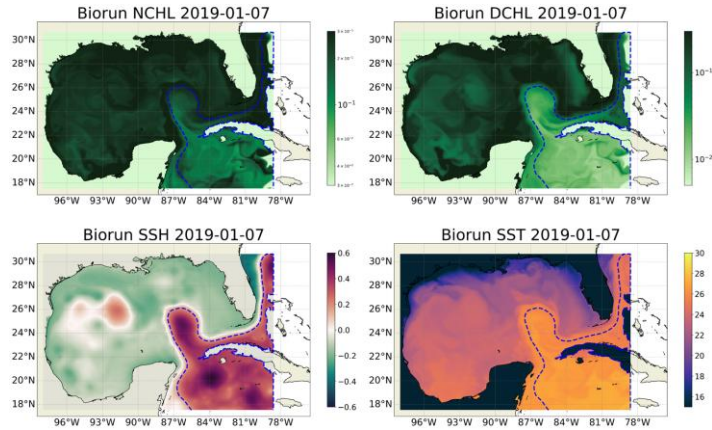

- Sea surface temperature and wind direction during Hurricane Katrina using the Navy Coastal Ocean Model NCOM.

- The simulated velocity of very strong deep currents in the Sigsbee Escarpment in the northern Gulf of Mexico using NCOM.

AI and Machine learning

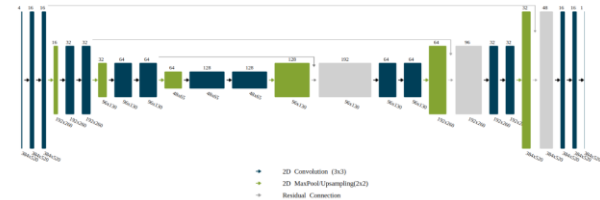

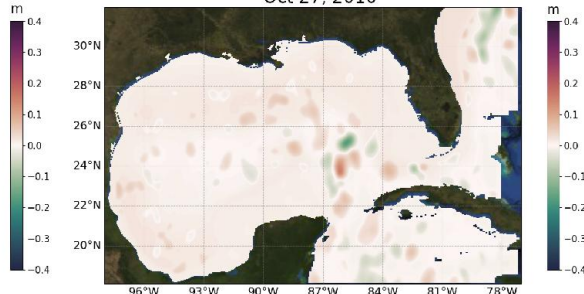

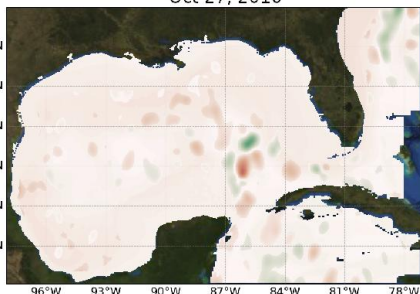

COAPS benefits from a cluster of 4 NVIDIA A100 GPUs for performing cutting-edge AI research. Our focus includes enhancing data assimilation in ocean models and integrating high-resolution satellite data to improve model accuracy in the Gulf of Mexico.

- ▲ Apply ML methods to develop analyses of dynamical fields associated with the LC and eddies from satellite ocean color for operational use and for assimilation in forecast models.

◀ Speeding up data assimilation system with the use of Convolutional Neural Networks

Marine Litter

Litter is found in all the world's oceans and seas, even in remote areas far from human contact due to its transboundary nature. The continuous growth in the amount of solid waste thrown away is leading to a gradual increase in marine litter found at sea, on the sea floor and coastal shores.

Modeled mismanaged plastic waste that provides statistics of marine litter by country

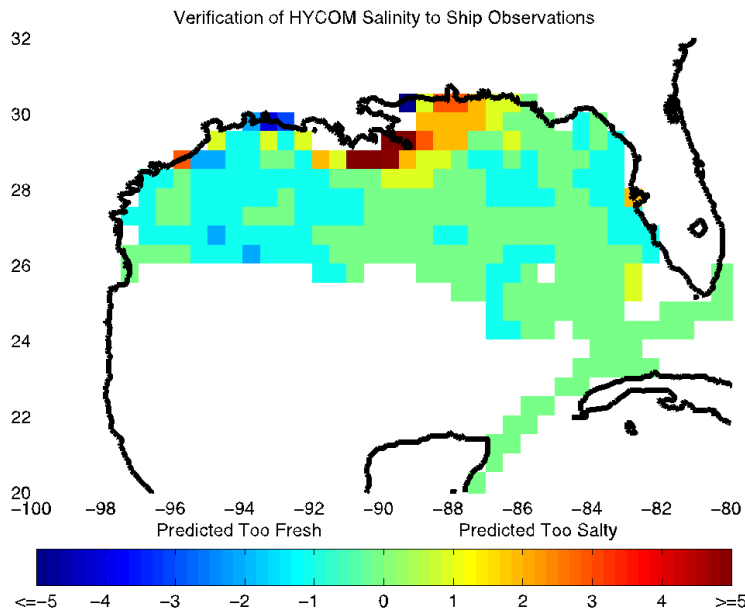

Marine Meteorology

Marine meteorology includes observing, analyzing, and modeling weather conditions in the marine environment in order to better understand the physics of marine storms and ocean-atmosphere interactions.

COAPS scientists developed the Shipboard Automated Meteorological & Oceanographic System (SAMOS), a network of oceanographic research vessels collecting marine observations

◀ Each vessel transmits nearly one-million observations per month using ship to shore satellite email communications

◀ SAMOS data is used to validate ocean model output, satellite products, and is made available to the international research community

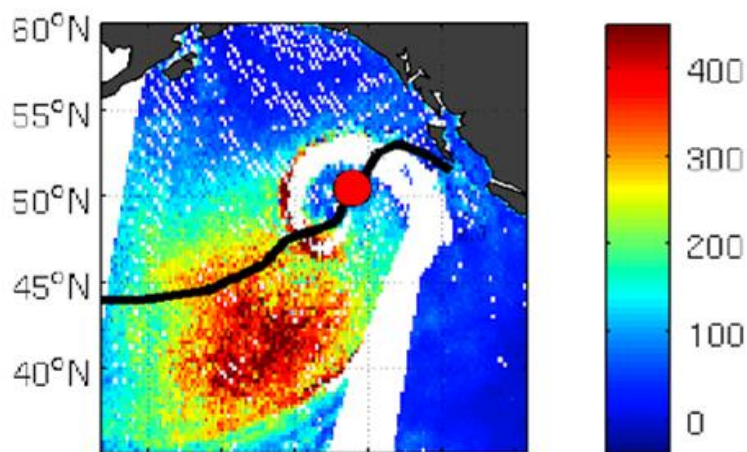

Air-Sea Interaction

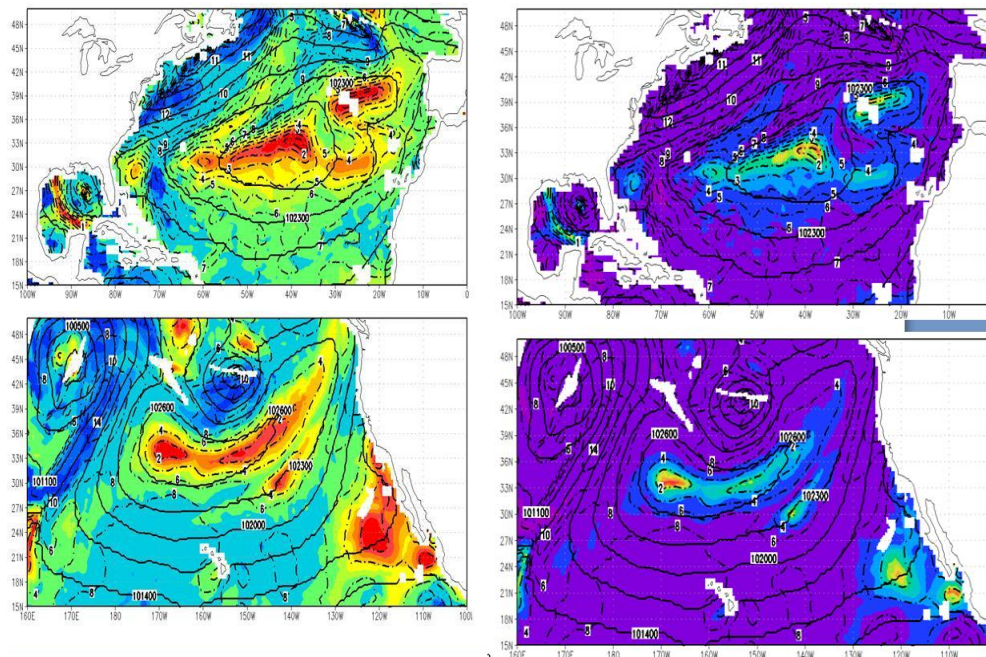

Air-sea interaction focuses on the exchange (or *flux*) of quantities, such as heat or moisture, across the ocean surface. These exchanges are sensitive indicators of changes in climate, and are directly related to floods, storm surge, droughts, storm intensity, and storm tracks. We are also improving air sea fluxes in a coupled model.

◀ The FSU in situ and satellite flux products provide a new set of ocean surface forcing fields which are well-suited for climate prediction studies.

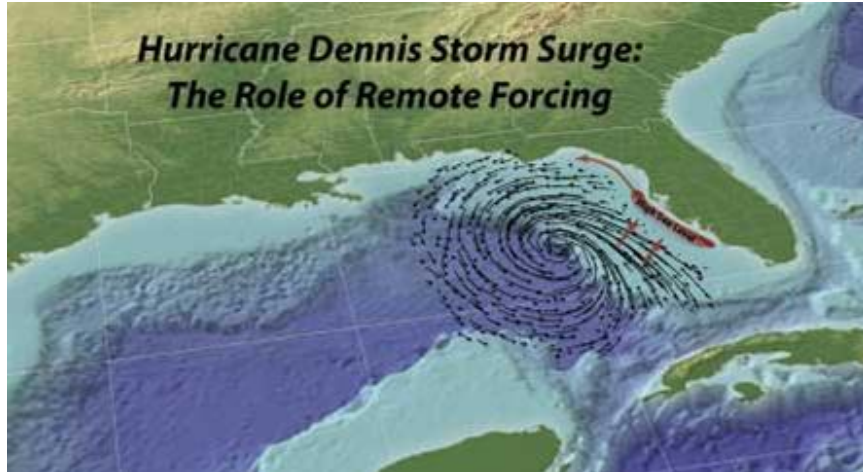

▲ Fluxes of sensible and latent heat from a warm core seclusion are retrieved from adjacent satellite tracks.

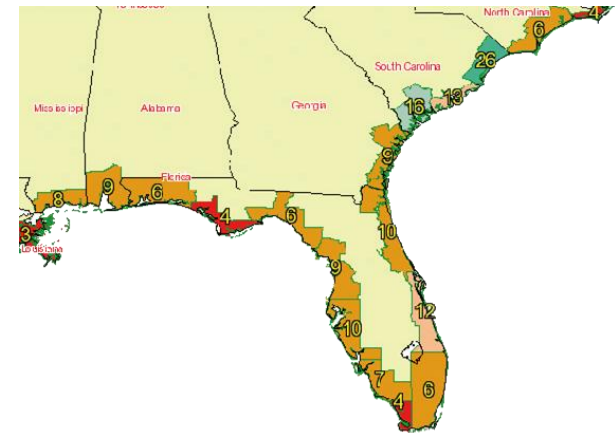

▲ Diurnal changes in SST (left) contribute to biases in latent heat fluxes (right). Averaged over a season, the tropical biases are typically $8\text{-}10\text{Wm}^{-2}$.

Coastal Studies

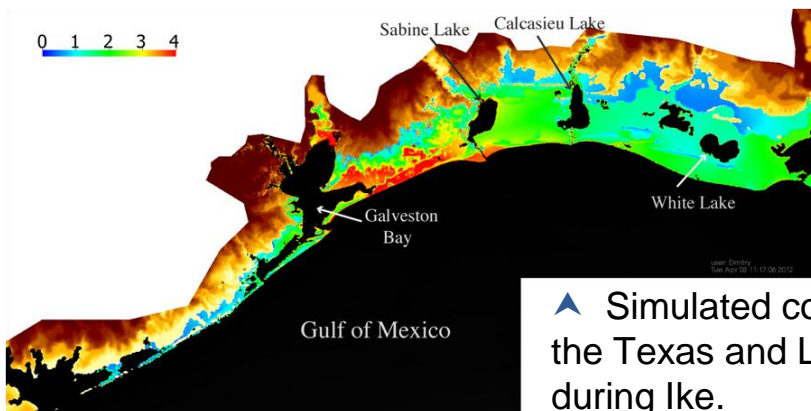

Scientists at COAPS conduct diverse studies in the terrestrial and marine coastal regions. Research topics include sea-level variability, the effects of terrestrial freshwater flux (river discharge) on the ocean and offshore environment, and coastal climate.

- Winds during Hurricane Dennis (2005) caused the sea level to rise along the Florida Peninsula, forming a coastally trapped wave. This wave was amplified by Dennis as it traveled to Apalachee Bay, and added several feet to the local wind-driven surge. New storm surge forecasting methods have been adopted to account for these remote effects.

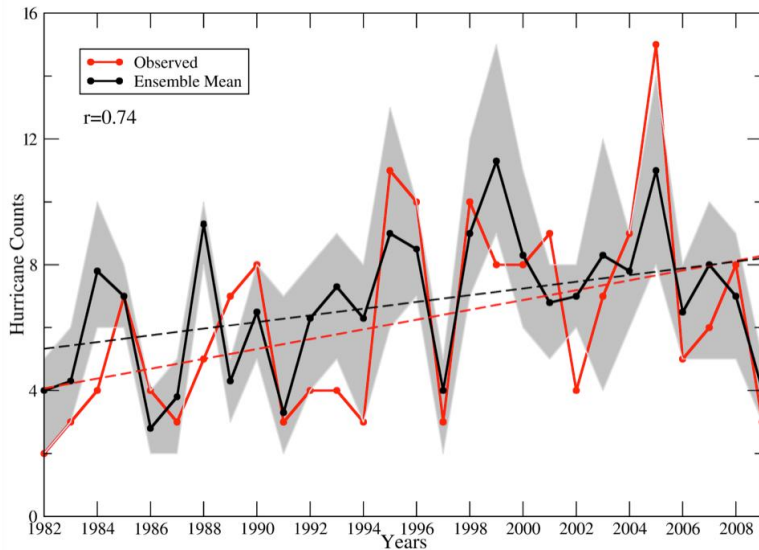

- The return frequency of a tropical storm or hurricane landfall. A return frequency of “9” indicates that, on average, a landfall occurs once every 9 years.

- Simulated coastal inundation along the Texas and Louisiana coasts during Ike.

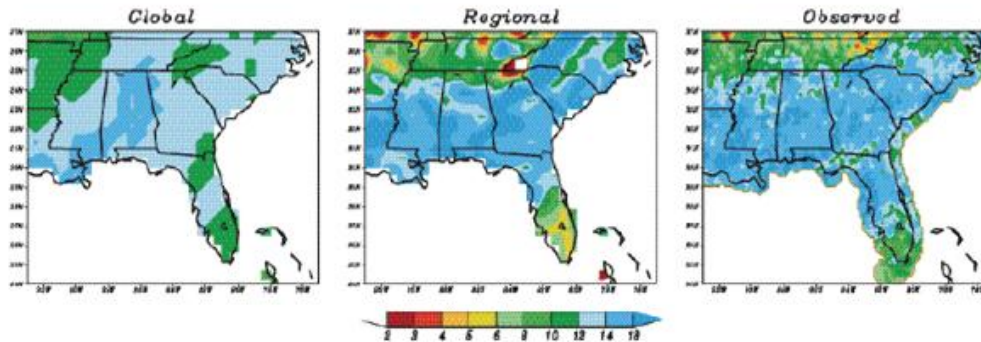

Seasonal Prediction

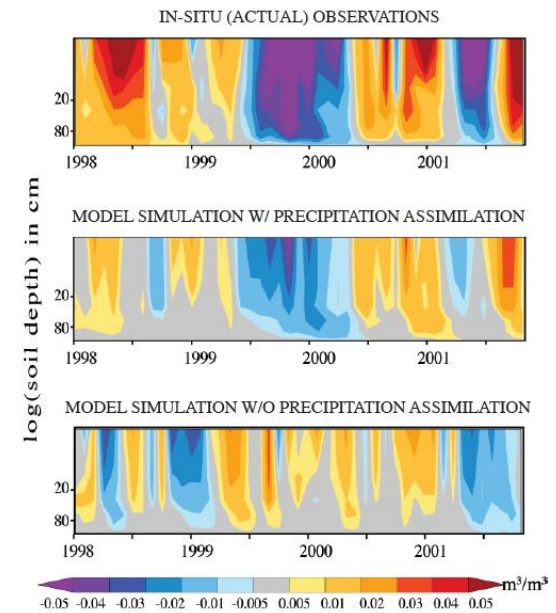

- Simulated and observed numbers of tropical cyclones in the Atlantic from 1982 to 2009.

Scientists at COAPS use global and regional atmospheric climate models to make seasonal predictions about hurricane activity in the Atlantic. These models are also used to help farmers in the Southeast United States increase their crop yields.

Vertical profile of average soil moisture anomalies across Illinois.

- Global and regional model predictions of the number of rainfall events greater than 12 mm/day for a winter season. The regional model proved more accurate than the global model.

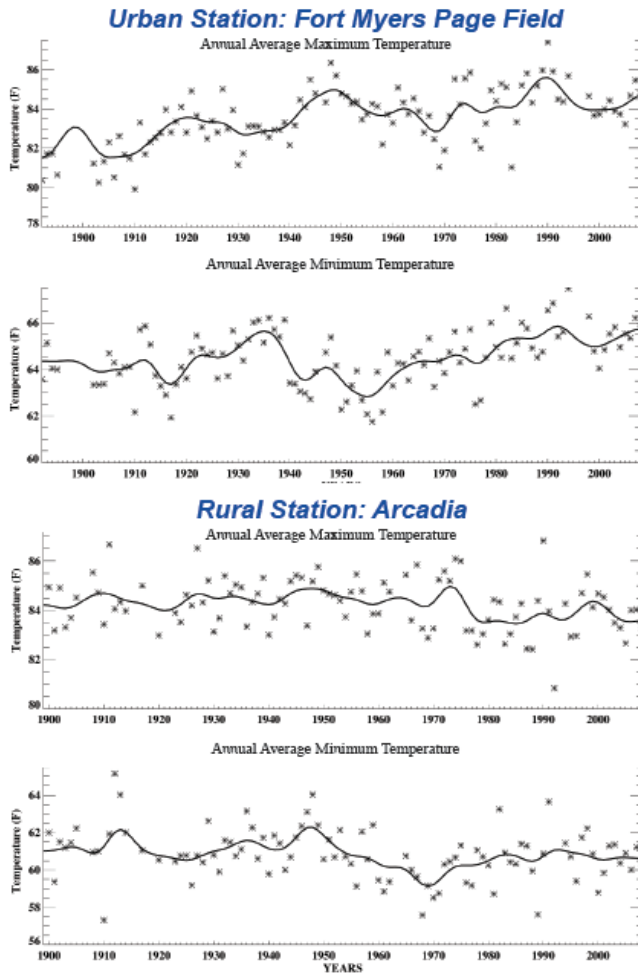

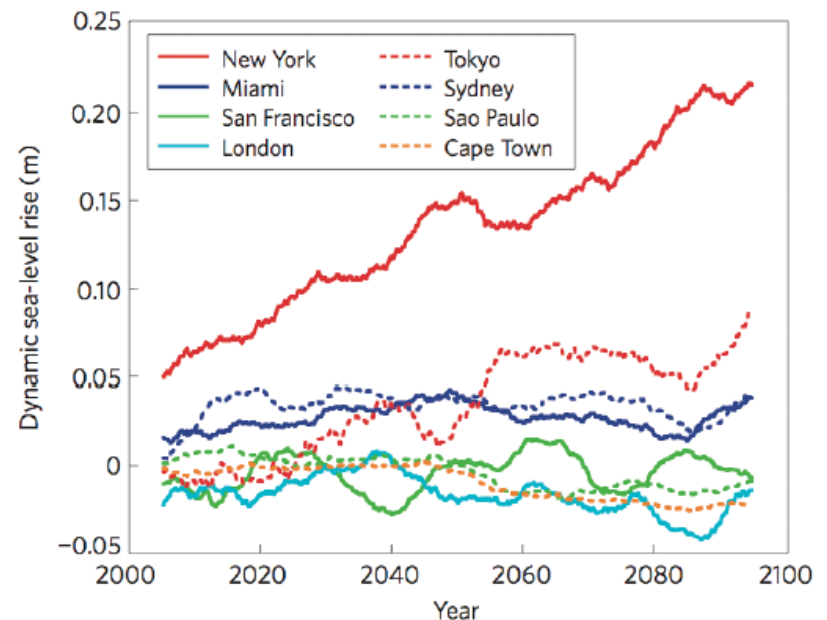

Climate Change

Climate change can occur under both natural and anthropogenic influences. As part of the Florida Climate Institute, COAPS is developing state-of-the-art climate models, identifying regional climate variability, and locating biases and uncertainties that can lead to inaccuracies in climate predictions. We are also studying changes in global tropical cyclone activity in the mid to late 21st century resulting from anthropogenic and natural climate variability.

Dynamic Sea Level Rise Projections

- Most rural weather stations in Alabama, Florida, and Georgia exhibit 1 to 3°F cooling over the last century, while stations influenced by the “urban heat island” effect show warming temperatures.

Outreach & Education

Through outreach and education, COAPS engages students, policy makers, and the general public in the process of scientific discovery and encourages a sense of stewardship for our natural environment.

▶ Through classroom and summer camp presentations, the FSU Young Scholars Program, and teacher professional development projects, we reach over 1,000 K-12 students each year.

▶ We regularly setup booths at local festivals to showcase COAPS research and engage the public in hands-on activities and demonstrations.

▶ We provide briefings to state policy makers on topics such as offshore wind energy and offer trainings and other materials to encourage our scientists to develop their communications skills.

Overview

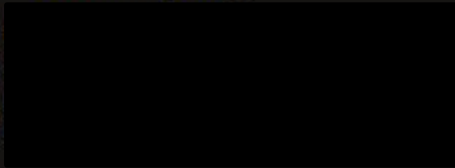

- Initiated in 2020
- Hosted by CEE Department: Interdisciplinary
- Joint between FSU and FAMU
- **\$3 million in annual research expenditures**
- 22 core faculty and 17 affiliates
- 5 administrative staff
- 80 graduate students and 8 postdocs

Labs

LABORATORY FOR RESILIENT MATERIALS AND STRUCTURES (ReMS)

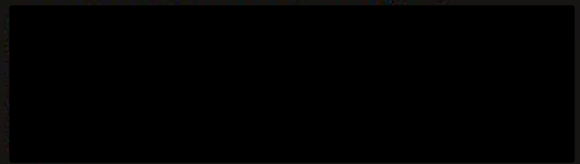

WATER SUSTAINABILITY AND COASTAL HAZARD (WaSCH) LAB

LABORATORY OF ADVANCED OPERATIONS RESEARCH AND RESILIENCE APPLICATIONS (LAORA)

LABORATORY FOR SUSTAINABLE INFRASTRUCTURE MANAGEMENT (SIM)

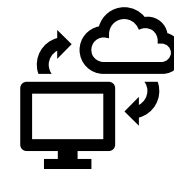

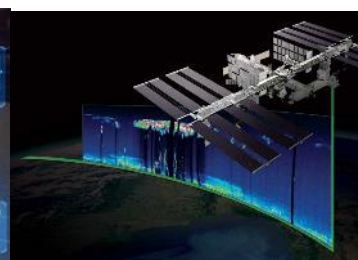

Main Goal:

Characterize hydroclimatic extremes and surface water pollution to support physical infrastructure design and risk mitigation plans

Main research areas:

- Compound weather events
- Future climate projections
- Climate and land cover change impacts
- Urban hydrology
- Surface water quality

WaSCH Lab

Water Sustainability & Coastal Hazards

WATER RESOURCES**

COLLEGE OF AGRICULTURE AND FOOD SCIENCES

The Center for Water Resources (CWR) is a research unit within the College of Agriculture and Food Sciences.

Mission Statement:

“To protect, improve, restore, and maintain Florida’s water resources and reduce water quality problems associated with agricultural practices and other human activities through **research, education, extension, and technology transfer.**”

Selected Research Projects

and in Partnership with Industry

<https://www.casfer.us/>

CASFER is an NSF Engineering Research Center dedicated to promoting a **nitrogen circular economy**.

The concept of a nitrogen circular economy envisions the recycling of N fertilizer in a manner that is economically sustainable.

CASFER is developing new technologies to recover N from human and animal waste streams and runoff at the source.

Join us at the 2024 CASFER Connect Symposium, Oct. 15-17, 2024 in Tallahassee, FL, where industry leaders, members, faculty, students, and stakeholders will explore pioneering insights and innovations. Together, we'll discuss transitioning from nitrogen cycle pollution to a circular economy by recycling waste streams and transforming value creation processes.
